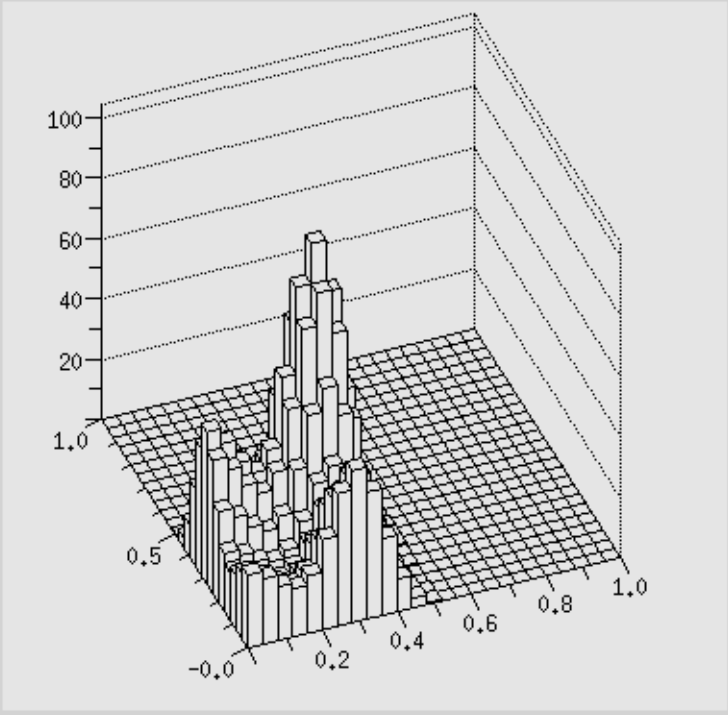
Interactive Document Demo

This document demonstrates how WWW could be used to create interactive documents, which would allow the reader not only to view but to interact with the data.



The user can interact with the above histogram using the mouse, to change the axis, or rotate the data.

It would also be possible to animate the display, for example by studying the effects of varying some other parameter.

Top Quark Mass

This demo uses the Nirvana widgets developed at Fermilab (presented at this conference by Mark Edel).
